## Unit Seven: Chapter 8 ~ Chemical Equations and Reactions

## Chemical Reactions

- A $\qquad$ is the process by which one or more
substances are $\qquad$ into one or more different substances.
- Creates $\qquad$ substances with $\qquad$ properties. $\cdots$ $\qquad$
- Also called a $\qquad$

## Indicators of a Chemical Reaction

$\qquad$
$\square$ (small amount of gas formed)

- $\qquad$ (more gas formed)
- $\qquad$ (large amount of gas formed)
$\bullet$ $\qquad$ :
$\qquad$ O $\qquad$

○ $\qquad$ $\circ$ $\qquad$
$\square$ :
$\qquad$
○

- May $\qquad$ to the bottom of liquids
- May $\qquad$ on top of liquids
( Looks like a $\qquad$ material

## Chemical Equations

$\qquad$ form of a chemical reaction using:

0 $\qquad$
( For elements

0 $\qquad$
( For compounds

○ $\qquad$
( Number in $\qquad$ of substances that tell $\qquad$ are in the reaction

## Chemical Equations

- 

○ $\qquad$

- $\qquad$ _:
- One or more substances (elements/compounds) that $\qquad$ a reaction
$\qquad$ :
- One or more $\qquad$ substances (elements/compounds)
$\qquad$ a reaction
- Special symbols:
$\qquad$ means yields / forms / makes / produces
- means plus / and / combined with

○ _ means solid

- Or $\qquad$ (crystalline)
- means liquid
- meansgas
$\circ$ means aqueous solution $\times$
- Terms written $\qquad$ $\rightarrow$ means the item is needed for the $\cdots$
$r$
r
$r$
$\times$

## Law of Conservation of Mass

- Chemical reactions must follow the law which states that $\qquad$
$\qquad$
- The $\qquad$ going into
reactions (in reactants) $\qquad$ come out of reaction (in products).
- Mass of the reactants $\qquad$ the mass of the products.
- This is why $\qquad$ chemical reactions $\qquad$ .

## Example Problems

- Ex. 1:

$$
\mathrm{Ag}_{2} \mathrm{O}(\mathrm{~s}) \rightarrow \quad \mathrm{Ag}(\mathrm{~s}) \quad+\quad \mathrm{O}_{2}(\mathrm{~g})
$$

- Ex. 2:

$$
\mathrm{Al}(\mathrm{~s}) \quad+\quad \mathrm{NiSO}_{4}(\mathrm{~s}) \rightarrow
$$

$$
\mathrm{Ni}(\mathrm{~s})+\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}(\mathrm{~s})
$$

- Ex. 3: Magnesium metal plus hydrochloric acid yields hydrogen gas and magnesium chloride.
- Ex. 4: Sodium metal and water react to form aqueous sodium hydroxide and hydrogen gas.
- Ex. 5: Calcium metal plus iodine react to produce calcium iodide.
- Ex. 6: $\quad \mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \quad \mathrm{CO}_{2}(\mathrm{~g})+\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
- Ex. 7: Aqueous magnesium nitrate reacts with aqueous potassium hydroxide to form solid magnesium hydroxide and aqueous potassium nitrate.

## **From UNIT 6: Extra Practice Naming and Writing Compounds:

- Dr. Alan's Chemistry Site: http://chemistry.alanearhart.org/Quizzes/Nomenclature/
- He offers quizzes with TONS of practice problems. In the drop down section, select from Binary Molecular Compounds, Binary Ionic Compounds, and/or Polyatomic Ionic Compounds!

## Extra Practice Balancing Chemical Equations:

- Dr. Alan's Chemistry Site: http://chemistry.alanearhart.org/Quizzes/Stoichiometry/
- He offers quizzes with TONS of practice problems. In the drop down section at the bottom of the page, select Balancing Chemical Equations. I'd suggest writing these problems on loose-leaf and keeping them in your homework binder so I can help you if you had any trouble with them.

## Types of Chemical Reactions

- So many chemical reactions can occur or are occurring that it would be
$\qquad$ to predict their products if it was not possible to place
many of them into $\qquad$ .
- Based on the $\qquad$ in reactions.

## Synthesis Reactions

$\qquad$ substances $\qquad$ ) combine to form
$\qquad$

- General Equation:
$\circ$ $\qquad$
(A and B can be $\qquad$ .
( AB is a $\qquad$ .
- Example: $2 \mathrm{Mg}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{MgO}(\mathrm{s})$

## Decomposition Reactions

- A $\qquad$ ( ) undergoes a reaction that produces $\qquad$ simpler substances ( $\qquad$ ).
- $\qquad$ of synthesis reactions.
- Most decomposition reactions take place only when $\qquad$ in the form
of $\qquad$ .
- The decomposition of a substance by an $\qquad$ is called $\qquad$ .
- General Equation:
$\circ$ $\qquad$
( AB is a $\qquad$ .
(A and B can be $\qquad$ .
- Example:
electricity
- $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \longrightarrow 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$

## Single Replacement Reactions

- Also known as $\qquad$ .
- $\qquad$ replaces a similar $\qquad$ in a $\qquad$

$\qquad$
(_ $)$.
- Many take place in $\qquad$ solution.
- Amount of $\qquad$ than in synthesis and decomposition reactions.
- General equation:
$\circ$ $\qquad$
( Positive oxidation (metal) $\qquad$ positive oxidation (metal).
- A and B are $\qquad$ .
- BC and AC are $\qquad$ .
- Example: $\mathrm{Mg}(\mathrm{s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\mathrm{MgCl}_{2}(\mathrm{aq})$
- General equation:
$\circ$ $\qquad$
( Negative oxidation (nonmetal) $\qquad$ negative oxidation (nonmetal).
- A and C are $\qquad$ .
- BC and BA are $\qquad$ .
- Example: $\mathrm{Cl}_{2}(\mathrm{~g})+2 \mathrm{KBr}(\mathrm{aq}) \rightarrow 2 \mathrm{KCl}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{l})$

## Double Replacement Reactions

- Or $\qquad$ .
- The $\qquad$ of two $\qquad$
$\square$ ) exchange
places in $\qquad$ solution to form two new $\qquad$
$\square$ ).
- One of the $\qquad$ formed is usually:
(A $\qquad$
(An insoluble $\qquad$ that $\qquad$ out of the solution
- Or a $\qquad$ , usually $\qquad$
- The other compound is often $\qquad$ and remains
$\qquad$ in the solution.
- General Equation:
$\circ$ $\qquad$
- All are $\qquad$ .
- Example: $2 \mathrm{KI}(\mathrm{aq})+\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq}) \rightarrow \mathrm{PbI}_{2}(\mathrm{~s})+2 \mathrm{KNO}_{3}(\mathrm{aq})$

## Combustion Reactions

- A substance (usually a $\qquad$ ) combines with
$\qquad$ releasing a large amount of $\qquad$ in the form of
$\qquad$ and $\qquad$ .
- The products are $\qquad$ and $\qquad$ .
- General Equation:

$$
\circ
$$

$\qquad$

- Example: $\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
- Balancing Tip: For combustion reactions, if there is no oxygen in the hydrocarbon reactant, an odd number coefficient cannot proceed water in the products. Take the odd number that would be necessary and double it, then balance the rest of the equation from there.

## Abbreviations

- Synthesis ( $\qquad$
- Decomposition

- Single replacement/displacement ( $\qquad$ or $\qquad$
- Double replacement/displacement ( $\qquad$ or $\qquad$
- Combustion ( $\qquad$ _)

## Activity Series

- The ability of an element to $\qquad$ is referred to as the element's $\qquad$ .
- The more $\qquad$ an element reacts with other substances, the
$\qquad$ its activity is.
- Activity series can be defined as $\qquad$
$\qquad$
$\qquad$ .
- This is based on their $\qquad$ .
- For metals, greater activity means a greater ease of $\qquad$ of electrons.

This forms $\qquad$ .

- For nonmetals, greater activity means a greater ease of $\qquad$ of electrons. This forms $\qquad$ .
- The activity series is usually determined by $\qquad$ reactions.
- In the activity series, the most active element is placed at the $\qquad$ and
can replace each of the elements $\qquad$ it from a compound in a
$\qquad$
- An element farther down in the activity series can replace any element
$\qquad$ it but not any $\qquad$ it.
- Activity series are used to help $\qquad$
- Examples:
- $2 \mathrm{Al}(\mathrm{s})+3 \mathrm{ZnCl}_{2}(\mathrm{aq}) \rightarrow 3 \mathrm{Zn}(\mathrm{s})+2 \mathrm{AlCl}_{3}(\mathrm{aq})$
- According to the activity series, Al is located $\qquad$ Zn and is therefore $\qquad$ to replace Zn in a compound.
- $\mathrm{Co}(\mathrm{s})+2 \mathrm{NaCl}(\mathrm{aq}) \rightarrow$ no reaction
- According to the activity series, Co is located $\qquad$ Na and is therefore $\qquad$ to replace Na in a compound so the reaction $\qquad$ .
- It is important to remember that like many other aids used to predict the products of chemical reactions, activity series are based on $\qquad$ .

## Chapter 9 ~ Stoichiometry

## Recipes

- What does a recipe tell you?
- The $\qquad$ amount of $\qquad$ to use in order to obtain a $\qquad$ amount of $\qquad$ .

## Recipes \& Balanced Equations

- A $\qquad$ chemical equation tells you what amounts of $\qquad$ to mix and what amounts of $\qquad$ to $\qquad$ .
- Chemists use balanced equations as a $\qquad$ how much $\qquad$ is needed or $\qquad$ is formed in a reaction.

When you know the quantity of $\qquad$ substance in a reaction, you can calculate the quantity of $\qquad$ substance
$\qquad$ or $\qquad$ in the reaction!

- Quantity can be measured in terms of $\qquad$
$\qquad$
$\qquad$ or

- 1. $\qquad$
- 2. $\qquad$
- mole = $\qquad$
- mole = $\qquad$

## Mole-Mole Ratio

- The $\qquad$ is a conversion factor derived from the $\qquad$
of a $\qquad$ chemical equation.
- Used to $\qquad$ between moles of $\qquad$
between moles of $\qquad$ , or between moles of $\qquad$ .
- Example: $\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}$

## Solving Stoichiometry Problems

- Check to make sure the equation is $\qquad$ .
- 1. $\qquad$ the given quantity (usually $\qquad$ ) to moles.
- 2. $\qquad$ the mole-mole ratio.
- 3. $\qquad$ to the desired units (usually $\qquad$
- HINTS © :
- If you start with $\qquad$ , you do not need step \# $\qquad$ .
- If you need to end with $\qquad$ , you do not need step \# $\qquad$ .
- You ALWAYS need step \# $\qquad$ .

## Example Problems!

- How many moles of sodium bromide will be produced when $\qquad$ mol of bromine reacts with sodium iodide to form sodium bromide and iodine?
- Suppose $\qquad$ g of aluminum reacts with sulfur to produce aluminum sulfide. How many moles of sulfur will be needed in this reaction?
- Nitrogen can react with hydrogen to produce ammonia $\left(\mathrm{NH}_{3}\right)$. How many grams of nitrogen will be needed to produce ___ mol of ammonia?
- In a reaction between carbon and oxygen, $\qquad$ g of carbon dioxide is formed. How many grams of carbon were burned?

## Extra Practice with Stoichiometry:

- Dr. Alan's Chemistry Site: http://chemistry.alanearhart.org/Quizzes/Stoichiometry/
- He offers quizzes with TONS of practice problems. In the drop down section at the bottom of the page, select Stoichiometry. Check the box to limit the molar masses to one decimal place. (NOTE: Your answers may not match up exactly with his due to rounding since we take the molar masses out to two decimal places). I'd suggest writing these problems on loose-leaf and keeping them in your homework binder so I can help you if you had any trouble with them.

## Reinforcement Problems!

- 1. One reaction that produces hydrogen gas can be represented by the following unbalanced chemical equation. What mass of HCl is consumed by the reaction of
$\qquad$ mol of magnesium?

$$
\mathrm{Mg}(\mathrm{~s})+\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{MgCl}_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})
$$

- 2. Acetylene gas $\left(\mathrm{C}_{2} \mathrm{H}_{2}\right)$ is produced as a result of the following balanced reaction.

$$
\mathrm{CaC}_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})
$$

If ___ $\quad \mathrm{g}$ of $\mathrm{CaC}_{2}$ are consumed in this reaction, how many moles of $\mathrm{H}_{2} \mathrm{O}$ are needed?

- 3. When sodium chloride reacts with silver nitrate, silver chloride precipitates. The other product is sodium nitrate. What mass of AgCl is produced from $\qquad$ g of $\mathrm{AgNO}_{3}$ ?
- 4. Copper reacts with silver nitrate through single replacement. If $\qquad$ g of silver are produced from the reaction, how many moles of copper (II) nitrate are also produced?
- 5. Iron is generally produced from iron ore through the following unbalanced reaction in a blast furnace.

$$
\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+\mathrm{CO}(\mathrm{~g}) \rightarrow \mathrm{Fe}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

If $\qquad$ kg of $\mathrm{Fe}_{2} \mathrm{O}_{3}$ are available to react, how many moles of CO are needed?

- 6. Aspirin, $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$, is produced through the following balanced reaction of salicylic acid, $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}$, and acetic anhydride, $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{3}$ :

$$
\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}(\mathrm{~s})+\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{3}(\mathrm{l}) \rightarrow \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}(\mathrm{~s})+\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}(\mathrm{l})
$$

What mass of aspirin (in kg ) could be produced from $\qquad$ mol of salicylic acid?

## Limiting Reactants

## Warm-Up

- You find 6 slices of bread, 9 pieces of meat, and 2 pieces of cheese in your kitchen.

- Each sandwich must have 2 pieces of bread, 3 pieces of meat, and 1 piece of cheese.
- How many sandwiches can you make with the ingredients you found in your kitchen?
- What ingredient limits the amount of sandwiches you can make?
- How many ingredients do you have left over?

## Limiting and Excess Reactants

$\qquad$ : the reactant that determines the $\qquad$
of product that can be $\qquad$ by a chemical reaction

- The $\qquad$ is $\qquad$ used up in a chemical reaction.
$\qquad$
$\qquad$ in a chemical reaction

## Example Problems!

- 1. Some rocket engines use a mixture of hydrazine, $\mathrm{N}_{2} \mathrm{H}_{4}$, and hydrogen peroxide, $\mathrm{H}_{2} \mathrm{O}_{2}$, as the propellant. The reaction is given by the following balanced equation:

$$
\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{l})+2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{l}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

- Which is the limiting reactant in this reaction when $\qquad$ mol of $\mathrm{N}_{2} \mathrm{H}_{4}$ is mixed with $\qquad$ mol $\mathrm{H}_{2} \mathrm{O}_{2}$ ?
- How much of the excess reactant, in moles, remains unchanged?
- 2. In a reaction chamber, $\qquad$ mol of aluminum is mixed with $\qquad$ mol of chlorine gas to produce aluminum chloride.
- Determine the balanced equation.
- What is the limiting reactant? What is the excess reactant? Label them in the balanced equation.
- How much of the excess reactant is left over, in moles, after the reaction goes to completion?
- What is the amount, in moles, of aluminum chloride produced?
- 3. $\qquad$ g of gold (III) sulfide reacts with $\qquad$ g of hydrogen gas to produce elemental gold and hydrogen sulfide.
- Determine the balanced equation.
- What is the limiting reactant? What is the excess reactant? Label them in the balanced equation.
- How much of the excess reactant, in grams, is left over after the reaction goes to completion?
- What is the amount, in grams, of elemental gold produced?
- 4. When $\mathrm{C}_{3} \mathrm{H}_{8}$ burns in oxygen, $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$ are produced. If $\qquad$ g of $\mathrm{C}_{3} \mathrm{H}_{8}$ reacts with $\qquad$ g of $\mathrm{O}_{2}$, how much $\mathrm{CO}_{2}$ is produced?
- Determine the balanced equation.
- What is the limiting reactant? What is the excess reactant? Label them in the balanced equation.
- How much of the excess reactant, in grams, is left over after the reaction goes to completion?
- What is the amount, in grams, of carbon dioxide produced?

## Pereent Yield

## Theoretical Yield

- The $\qquad$ amount of product that can be $\qquad$ from
a given amount of reactant.
- The value that has been $\qquad$ using a stoichiometry problem.

## Actual Yield

- The $\qquad$ amount of a product obtained from a chemical reaction.

## Percent Yield

- The $\qquad$ and $\qquad$ yields are used to calculate the
$\qquad$ .
- $\qquad$ is the ratio of the $\qquad$ yield to the
yield, multiplied by $\qquad$ .

## Example Problems:

- 1. Methanol $\left(\mathrm{CH}_{3} \mathrm{OH}\right)$ can be produced through the reaction of carbon monoxide and hydrogen gas in the presence of a catalyst. If ___ g of CO reacts to produce $\qquad$ $\mathrm{g} \mathrm{CH}_{3} \mathrm{OH}$, what is the percent yield of $\mathrm{CH}_{3} \mathrm{OH}$ ?
- 2. Quicklime, CaO , can be prepared by roasting limestone, $\mathrm{CaCO}_{3}$, according to the chemical equation below. When $\qquad$ g of $\mathrm{CaCO}_{3}$ are heated, the actual yield of CaO is $\qquad$ g. What is the percentage yield?

$$
\mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}
$$

- 3. For the unbalanced equation shown below, if the reaction of g of
$\mathrm{O}_{2}$ produces $\qquad$ g of $\mathrm{H}_{2} \mathrm{O}$, what is the percent yield?

$$
\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

- 4. 

$\mathrm{Mg}+\mathrm{HNO}_{3} \rightarrow \mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2}$

- If I start this reaction with $\qquad$ g of magnesium and an excess of nitric acid, how many grams of hydrogen gas should I be able to produce? If $\qquad$ g of hydrogen was actually produced, what was my percent yield of hydrogen?

## Exam Date:

- Chemical Equations \& Reactions (Chapter 8)
$\checkmark$ chemical reaction / indicators of reaction
$\checkmark$ Law of Conservation of Mass
$\checkmark$ balancing equations (coefficients / special symbols)
$\checkmark$ types of reactions
$\checkmark$ activity series
- Stoichiometry (Chapter 9)
$\checkmark$ mole ratio / molar mass / balanced equations for chemical reactions
$\checkmark$ solve for amount of R or P in moles or mass
$\checkmark$ limiting reactants
$\checkmark$ \% yield / theoretical yield / actual yield
