

## **Grades 6-8**

### **Life Science Curriculum Framework**

#### **Introduction**

Science, Technology & Engineering, and Environmental Literacy & Sustainability (STEELS) Standards guide the study of the natural and human-made world through inquiry, problem-solving, critical thinking, and authentic exploration. This document displays a curriculum framework for **Grades 6-8 Life Science**. It is designed to focus curriculum and teaching, provide guidance for multiple approaches to curriculum development, encourage less reliance on textbooks as curriculum, and avoid activity-oriented teaching without focus/purpose.

#### **Science Long Term Transfer Goals**

In support of the Curriculum Framework, Long Term Transfer Goals (LTTG) provide the overarching practices that ground the foundation for a robust curriculum; thus, all curricula should relate to one or more of the LTTGs detailed below – as they highlight the effective uses of understanding, knowledge, and skill that we seek in the long run; i.e., what we want students to be able to do when they confront new challenges – both in and outside of school.

Students will be able to engage as scientifically literate members of a global society, using their learning to:

1. Approach science as a reliable and tentative way of knowing and explaining the natural world and designed world.
2. Weigh evidence and use scientific approaches to ask questions, investigate, and make informed decisions.
3. Make and use observations to analyze relationships and patterns in order to explain phenomena, develop models, and make predictions.
4. Evaluate systems, in order to connect how form determines function and how any change to one component affects the entire system.
5. Explain how the natural and designed worlds are interrelated and the application of scientific knowledge and technology can have beneficial, detrimental, or unintended consequences.

| Structure and Function                                                             |                                                                                       |                                                                                                                                                                             |                                                                                                                                                                         |                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                |                                                                                                                                          |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Key Understanding                                                                  | Driving Question                                                                      | Standard                                                                                                                                                                    | Science and Engineering Practices                                                                                                                                       | Disciplinary Core Idea                                                                                                                                                                                                      | Crosscutting Concepts                                                                                                                                                                                                                                                                          | Vocabulary                                                                                                                               |
| All living things are made of one or more cells.                                   | What evidence could be used to distinguish between living and nonliving things?       | <b>3.1.6-8.A</b><br><b>Conduct an investigation to provide evidence that living things are made of cells, either one cell or many different numbers and types of cells.</b> | <b>Planning and Carrying Out Investigations</b><br>Conduct an investigation to produce data to serve as the basis for evidence that meet the goals of an investigation. | All living things are made up of cells, which is the smallest unit that can be said to be alive. An organism may consist of one single cell (unicellular) or many different numbers and types of cells (multicellular).     | <b>Scale, Proportion, and Quantity</b><br>Phenomena that can be observed at one scale may not be observable at another scale.                                                                                                                                                                  | biology<br>cell<br>multicellular<br>organism<br>unicellular                                                                              |
| All cells have structures that perform specific functions necessary for life.      | How do the structures of the cell enable life's functions?                            | <b>3.1.6-8.B</b><br><b>Develop and use a model to describe the function of a cell as a whole and the ways that parts of cells contribute to the function.</b>               | <b>Developing and Using Models</b><br>Develop and use a model to describe phenomena.                                                                                    | Within cells, special structures are responsible for particular functions, and the cell membrane forms the boundary that controls what enters and leaves the cell.                                                          | <b>Structure and Function</b><br>Complex and microscopic structures and systems can be visualized, modeled, and used to describe how their function depends on the relationships among its parts, therefore complex natural structures/systems can be analyzed to determine how they function. | cell membrane<br>cell wall<br>chloroplast<br>mitochondria<br>nucleus<br>organelle                                                        |
| The body is composed of interacting subsystems made of cells, tissues, and organs. | How do subsystems work together to contribute to the overall function of an organism? | <b>3.1.6-8.C</b><br><b>Use arguments supported by evidence for how the body is a system of interacting subsystems composed of groups of cells.</b>                          | <b>Engaging in Argument from Evidence</b><br>Use an oral and written argument supported by evidence to support or refute an explanation or a model for a phenomenon.    | In multicellular organisms, the body is a system of multiple interacting subsystems. These subsystems are groups of cells that work together to form tissues and organs that are specialized for particular body functions. | <b>System and System Models</b><br>Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.                                                                                                                                                 | circulatory system<br>digestive system<br>excretory system<br>muscular system<br>nervous system<br>organ<br>respiratory system<br>tissue |

| Growth and Development of Organisms                                                                                                  |                                                                                 |                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                |                                                                                                                                                                |                                                                   |

| Matter and energy are transferred between organisms as they interact in an ecosystem. | How do energy and matter flow through an ecosystem?                                      | <b>3.1.6-8.K</b><br><b>Develop a model to describe the cycling of matter and flow of energy among living and nonliving parts of an ecosystem.</b> | <b>Developing and Using Models</b><br>Develop a model to describe phenomena.                                                                                                           | Food webs are models that demonstrate how matter and energy is transferred between producers, consumers, and decomposers as the three groups interact within an ecosystem. Transfers of matter into and out of the physical environment occur at every level. Decomposers recycle nutrients from dead plant or animal matter back to the soil in terrestrial environments or to the water in aquatic environments. The atoms that make up the organisms in an ecosystem are cycled repeatedly between the living and nonliving parts of the ecosystem. | <b>Energy and Matter</b><br>The transfer of energy can be tracked as energy flows through a natural system. | aquatic ecosystem<br>consumer<br>decomposer<br>energy flow<br>matter cycling<br>producer<br>terrestrial ecosystem |

| Ecosystem Dynamics, Functioning, and Resilience         |                                                                               |                                                                                                                                                                        |                                                                                                                                                                                                                                          |                                                                                                                                                                                               |                                                                                                                 |                                                                           |

| Genes are responsible for making proteins that determine the traits of an organism. | How do genetic mutations affect the structure and function of an organism? | <b>3.1.6-8.M</b><br><b>Develop and use a model to describe why structural changes to genes (mutations) located on chromosomes may affect proteins and may result in harmful, beneficial, or neutral effects to the structure and function of the organism.</b> | <b>Developing and Using Models</b><br>Develop and use a model to describe phenomena. | Genes are located in the chromosomes of cells, with each chromosome pair containing two variants of each of many distinct genes. Each distinct gene chiefly controls the production of specific proteins, which in turn affects the traits of the individual. Changes (mutations) to genes can result in changes to proteins, which can affect the structures and functions of the organism and thereby change traits.<br>In addition to variations that arise from sexual reproduction, genetic information can be altered because of mutations.<br>Though rare, mutations may result in changes to the structure and function of proteins. Some changes are beneficial, others harmful, and some neutral to the organism. | <b>Structure and Function</b><br>Complex and microscopic structures and systems can be visualized, modeled, and used to describe how their function depends on the shapes, composition, and relationships among its parts, therefore complex natural structures / systems. | chromosome<br>gene<br>mutation<br>protein |

| Natural selection is a process by which species change over time.                       | How do changes in the environment influence populations of organisms over multiple generations? | <b>3.1.6-8.T</b><br><b>Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time.</b> | <b>Using Mathematics and Computational Thinking</b><br>Use mathematical representations to support scientific conclusions and design solutions. | Adaptation by natural selection acting over generations is one important process by which species change over time in response to changes in environmental conditions. Traits that support successful survival and reproduction in the new environment become more common; those that do not become less common. Thus, the distribution of traits in a population changes. | <b>Cause and Effect</b><br>Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability. | adaptation<br>generation |
